

Olja Vasić

## **Nikola Diklić (1925-2008)**

Dr Nikola Diklić, one of the greatest Serbian botanists, passed away on Sunday, November 16<sup>th</sup>, 2008.

For some people he was Nikola, for some Nidža or Nina, but for me he was always simply Dr Diklić. It was more than the title itself and more than simply addressing a more experienced elder colleague. Dr Diklić symbolised a great friend and a reliable guide through the challenges of a botanist's life.

Dr Diklić was born in the village Kupusina near Sombor (Vojvodina) on December 19<sup>th</sup>, 1925, on the same day on which the Natural History Museum had been founded 30 years before. Perhaps that coincidence decided the path of his life, which through studies of biology at Belgrade University (1948—1953) brought him to the Natural History Museum.

At the Natural History Museum, where he found the ideal surroundings to completely and peacefully dedicate his time to botany, Dr Diklić spent his whole active working years, 37 in all (1953—1990). The study of plants meant more than work to him; it was his way of life.

When in mid 20<sup>th</sup> century he came to the Museum, he was awaited by large piles of unprocessed herbarium material that his predecessors had been collecting for years. He started his work by dedicating a great deal of time and energy to identify, sort and process these specimens, transforming a huge bulk of gatherings, through reorganization and classification, into a real scientific collection based on the principles of botany and museology. Perhaps unintentionally, he thereby prepared the invaluable material base that in the following decades would become the indispensable foundation for the *Flora SR Srbije/Flora Srbije* and *Vegetacija SR Srbije/Vegetacija Srbije*. He already knew, at that time, that serious scientific work cannot be accomplished without order and system.

He also knew that plants should not be studied only as dried and pressed specimens but seen and experienced alive, in their natural environment. There was no mountain in Serbia that Dr Diklić did not climb, no gorge or canyon he did not pass, no river valley he did not explore, each time bringing back new data, records and experiences. He also made occasional trips to other parts of then Yugoslavia, and other Balkan countries; but the great love of his botanical life was to remain the flora of Serbia.

Of seemingly fragile body build, he mastered the most difficult terrains with surprising perseverance and persistence, armed with that inner strength that pushes the real researcher ever further and higher, unaware of hindrances and discomfort.

Dr Diklić was an ideal combination of museum curator and investigator. In the best museological tradition, he collected over 200,000 of the about half-million specimens that

Fig. 1. Nikola Diklić at the XI OPTIMA Meeting in Belgrade (2004).

the General Herbarium of Balkan Peninsula of the Natural History Museum in Belgrade now includes, keeping an ever watchful eye on the whole material, whether inherited from his predecessors or collected and prepared them with his own hands. It is not uncommon for a curator to limit his activities on collecting and processing of the material. However, for Dr Diklić it was just the beginning of research and scientific screening, usually resulting in the publication of new biogeographical, floristic, taxonomic or phytocoenological data and analyses. Naturally, his efforts resulted in the academic title of Doctor of Science (his thesis: Monograph of the genus *Vicia* L. in Yugoslavia, University of Ljubljana, 1966) and the highest distinctions in science (scientific adviser) and museology (museological adviser).

His retirement did not stop Dr Diklić from being associated with the flora of Serbia in all its aspects, nor did it sever his links with the Museum, which he visited regularly, not

just to refresh his memories but to continue working.

### **Contribution to the Serbian botany**

When I met Dr Diklić for the first time, as a young assistant back in 1974 at my first scientific meeting, the Congress of Biologists of Yugoslavia in Sarajevo, he held in his hand the freshly printed sixth volume of the *Flora SR Srbije*. I knew that for the previous 5 volumes he had prepared numerous families (*Ranunculaceae*, *Violaceae*, *Cruciferae*, *Fabaceae*, *Dipsacaceae*, etc), alone or in co-authorship. However it was only through our subsequent cooperation that I came to appreciate that Dr Diklić is the very soul of that work, and that Flora of Serbia, and Flora of the SR Serbia, are so to say his middle name.

The contribution of Dr Diklić to the knowledge of the diversity of the Serbian flora includes his discovery of 310 taxa (97 species, 44 subspecies, 54 varieties and 115 formae) not previously known from the area, as well as 14 taxa and 6 plant communities new to science. Even before his time the flora of Serbia was already pretty well investigated. Such an important contribution as his was only possible as a result of thoroughly planned, extensive and persistent field work combined with meticulous, critical analysis of the taxa. His new results were published in 564 papers, book chapters and presentations at several dozens of national and international scientific meetings.

Of equal importance is the influence that Dr Diklić, through his competent work, exerted on an improved perception, in Serbia, of the value of fundamental botanical research. At a time when floristic and taxonomic studies were considered as outdated and phytocoenology was jubilantly celebrated as modern, Dr Diklić achieved his great advances in exactly these unfashionable disciplines. Besides, on countless occasions he demonstrated that phytocoenological results are no better or more credible than the floristic and taxonomic data on which they are based.

By working unobtrusively but persistently and always using factual arguments only, he attracted and gathered around him numerous younger botanists, still actively studying the floristic and taxonomic diversity of flora of Serbia and the Balkan countries.

In spite of being a supervisor and committee member for numerous students acquiring the academic Masters and Doctoral degree, he was never formally involved in university teaching. He nevertheless transferred his knowledge to younger colleagues with great pedagogical skill, through personal contact or project cooperation. Many of us, not only botanists, consider him unofficial but effective teacher who never spared time and effort to unreservedly share his knowledge and experience with them.

As a man of broad interests, he did not limit himself to his main area of activity. He often accepted cooperation with and offered help to colleagues in applied or related disciplines, in neighboring Faculties of Belgrade University, such as pharmacy, veterinary medicine, agriculture and forestry. He was well aware of the importance, for the value of results in, e.g., plant physiology, pharmacy and pharmacognosy, of reliable data on the species used, and innumerable times he contributed expert identification of plant material and reliable taxonomic, chorological and ecological information to such studies.

As member of the Committee for the flora and vegetation of the Serbian Academy of Sciences and Arts, since its beginnings in 1965, he was actively involved in all phases of

preparing and publishing the ten-volume *Flora SR Srbije*. Not only did he author the treatments of 772 of the about 4000 species, but with his extraordinary knowledge of the flora and his great experience in the principles of classification, taxonomy and nomenclature, he greatly improved the quality of the whole work by revising and editing the texts of others.

Publication of the tenth volume (or second supplement) of the *Flora SR Srbije*, of which he was both editor and principal text author, did not put an end to Dr Diklić's involvement with this work. He continued to assemble new material, check and revise the data. He soon realised the necessity of producing a new, amended edition, not only because the first edition was no longer available from stock, but also because of the new knowledge that had accumulated in the meantime.

In spite of a very difficult economic situation in Serbia, thanks to his enthusiasm and great perseverance, the first volume of that new edition, now under the title *Flora Srbije*, appeared in 1992 – after which he immediately started to prepare the manuscripts for the second and third volumes.

In the so far published volumes of *Vegetacija SR Srbije* continued as *Vegetacija Srbije*, he authored two chapters, of which that on šibljak, due to the peculiarity and complexity of that vegetation type, is of highest importance.

Dr Diklić acted as the editor of three books: *Flora SR Srbije*, vol. 10, and Josif Pančić's complete works, vol. 1 and 2; furthermore he edited the scientific journal *Glasnik Prirodnjačkog muzeja u Beogradu*, ser. B. His knowledge and experience as long-term member of the editorial boards of many publication series were priceless: *Flora SR Srbije / Flora Srbije*, *Vegetacija SR Srbije / Vegetacija Srbije*, *Crvena knjiga flore Srbije*, and Josif Pančić's complete works.

He actively participated in all scientific biological societies of Serbia and Yugoslavia, and was vice-president or executive board member in many of them.

### Contribution to the Balkan and Mediterranean flora

The scientific material comprised in Dr Diklić's papers transcends the national limits in importance, as it also represents a significant contribution to the knowledge of the diversity, dynamics and genesis of the flora of the Balkan Peninsula and the whole Mediterranean area. When collating phytogeographical data on taxa occurring in Serbia and former Yugoslavia, he at the same time expanded and increased the knowledge of their total distribution. In his taxonomic revisions Dr Diklić always used specimens originating from outside Serbia and Yugoslavia for comparison, which enabled him to conclusions of far more than local significance. Important examples are *Nepeta rtanjensis* Diklić & Milojević, *N. ernesti-mayeri* Diklić & Nikolić, *Althaea vranjensis* Diklić & Nikolić, and the associations *Artemisio-Salvietum officinalis* Nikolić & Diklić 1966, *Trifolieto-Festucetum vallesiaca* Diklić & Nikolić 1972 and *Nepeto-Festucetum vallesiaca* Diklić & Milojević 1976, all new to science. Dr Diklić had also contributed to the knowledge of the Mediterranean flora in his capacity of national adviser for former Yugoslavia in the Med-Checklist project.

No database on the flora of the Balkan Peninsula, Europe or the Mediterranean area can be considered as complete without the information included in the *Flora SR Srbije / Flora Srbije*, Dr Diklić's numerous papers, and the General Herbarium of the Balkan Peninsula

of the Natural History Museum in Belgrade, which Dr Diklić collected, processed and published during more than half a century.

### **Contribution in OPTIMA**

Considering the scientific field and geographic area in which Dr Diklić was active, the botanical association ideally suited to his needs was OPTIMA, of which he became a member in 1977. Since then, he regularly participated in OPTIMA Meetings, always contributing important new results on the flora of Serbia. In time, his role in OPTIMA gradually increased in scope: in 1983 he became a member of the International Board, from 1989 to 2007 also of the Executive Council, and in the period 1989-1995 he was OPTIMA's vice-president. Furthermore, he was a member of the Commission for collections and herbaria in 1983-1989.

At the same time, Dr Diklić was an active promoter of OPTIMA, not only among Serbian botanists but throughout former Yugoslavia. Especially after the OPTIMA Meeting in Delphi (Greece), where the organisation of the subsequent Meeting in 1992 was entrusted to the Natural History Museum in Belgrade, Dr Diklić enrolled many botanists from then Yugoslav scientific centres as new members of OPTIMA.

Dr Diklić always enjoyed participating in OPTIMA Meetings, not only in the scientific programme, but also socially, making good friends among his colleagues thanks to his communicative gifts. His greatest wish, as he used to say, was to bring OPTIMA to Belgrade. He was very much aggrieved when, due to the political situation of the time, the 1992 Meeting could not take place in Belgrade as planned. Eventually, however, his wish became reality in 2004. As President of the Programme Committee he led the XI OPTIMA Meeting, the organisation of which, thanks to his reputation, had again been entrusted to the Natural History Museum in Belgrade.

### **Awards**

Very modest and primarily dedicated to his work, Dr Diklić never expected official awards. To him, the greatest possible recognition was that the results should find their place within the overall mosaic of knowledge – as is indeed happening in his case. His papers are not only the basis of numerous further, fundamental and applied endeavours, but at the same time the data, analyses and conclusions they contain provide the reference to critically assess the scientific value and importance of other authors' results.

His results also earned him six outstanding awards, and Dr Diklić was especially fond of two international awards, not because they came from abroad, but because they were bestowed by his fellow botanists.

For his work on *Flora SR Srbije* he received the October Award (the City Parliament of Belgrade's highest recognition) in 1970, the Award "Mihajlo Valtrović" (by the Museum Society of Serbia) in 1987, and the Award of July 7<sup>th</sup> (the highest recognition of the Presidential Board of the SR of Serbia) in 1988. The Silver Plaque awarded in Palermo in 2001 by the *Fondazione internazionale Pro Herbario Mediterraneo* testifies to the fact that botanists outside of Serbia

had also recognised his importance in preparing this first-rate national publication.

In 1995, on the occasion of the Centennial Celebrations of the Natural History Museum in Belgrade, he received the diploma *Custos Musei Historiae Naturalis, honoris causa*, with the right to bear the title of Honorary Curator for next 100 years.

Finally, the award of the prestigious OPTIMA Gold Medal, in 2004, testifies to the high scientific value of his research on the flora of Serbia, former Yugoslavia, the Balkan Peninsula and the whole Mediterranean area, honours his maintenance of high standards in Serbian floristic and taxonomic studies, his contribution to the education of the young generation of Serbian botanists, and his active involvement in OPTIMA during almost three decades.

At the onset I wrote that for Dr Diklić, studying plants was a way of life. But that does not mean that he was enthralled with plants as his one and only preoccupation and purpose.

Dr Diklić was a particularly realistic, rational and reasonable person. He kept his eyes and mind open and interested in everything that happened around him. He was always benevolent, generous, reliable, unselfish and extremely tolerant, both in his work and in everyday life, yet he never failed to notice, comment on or disapprove of mistakes and carelessness, both his own and other people's.

He loved life. He had an extraordinary sensitivity for beauty in all its shapes and appearances. He knew how to be happy and how to enjoy the little things. He sincerely felt joy for the success and happiness of others. And, perhaps most importantly: he was able in his unobtrusive, gentle way to always make us feel welcome, at ease and comfortable in his presence, and to trust him unhesitatingly in every respect.

He was an extraordinary and rare person, with the best of human qualities. It is therefore but natural that, by his persevering hard work, he became a recognised, internationally renowned scientist, while his fine character earned him high respect and love among his friends and colleagues.

Perhaps the following words, sent after the death of Dr Diklić by one of our friends and colleagues from Spain, are the best way to represent Nikola Diklić, and I believe that he would take pleasure in reading them: "*In current times, he was for me the prototype of the kind of warm, simple and human person that I hope to become some day*".

Address of the author:  
Olja Vasić  
Curator of Botany  
Natural History Museum, Belgrade  
Belgrade, 03/12/2008.
